What's in a name?

"What's in a name? That which we call a rose by any other name would smell just as sweet."

William Shakespeare uses this line in his play *Romeo and Juliet* to convey that the naming of things is irrelevant. Do you agree?

- ▶ Why call *Program Construction*?
- ▶ Why not *Programming*?

Program Construction Methodology

Program construction methodology has many different phases of activity.

- ▶ One part of it covers the overall system including hardware, software, users, operating environment, rules and regulations, etc.
 - ▶ Other part covers software development.
-
- ▶ An **algorithm** can be represented using a natural language, flow charts, pseudo-code, or a structured language.
 - ▶ Programming is coding an algorithm to a **program** using a programming language like C, C++, C#, Java, Python, Go, JavaScript, Go, ...
 - ▶ Program construction is a **methodological process** to start from a user's requirements and end with a working program as the final product.

Program Construction Methodology - System Level

Example: The customer needs a system to collect rainfall data island-wide in real-time at a low-cost using crowd-sourcing.

- ▶ System requirements analysis
- ▶ System requirements specification
- ▶ System architecture design
- ▶ System validation (checking if the specification captures the customer's requirements)

Program Construction Methodology - Software Level

Example: Record the start and end of a rainfall event, Provide a subjective evaluation of amount of rainfall, Transmit data to a central repository, etc.

- ▶ Software requirements analysis
- ▶ Software requirements specification
- ▶ Software architecture design
- ▶ Software component/module design
- ▶ Program coding and testing
- ▶ Software deployment and maintenance
- ▶ Software verification (checking if the software meets the specifications)

A Classification of Requirements

Requirements form the foundation of program construction: the more accurately the requirements are elicited, recorded, and used; the more satisfying the final outcome from the users point of view.

Requirements are broadly classified to two types.

1. Functional requirements
2. Non-functional requirements

What are Functional Requirements?

Two broad approaches to define functional requirements:

1. Based on **functionality**
2. Based on **behaviour**

- ▶ A **functional** requirement specifies:
 - ▶ a function that a system must be able to perform, or
 - ▶ what the product must do, or
 - ▶ what the system must do
- ▶ A **behavioural** requirement specification describes:
 - ▶ the behavioural aspects of a system or
 - ▶ the behavioural relationship between input/stimuli and output/response in a system

A Definition for Functional Requirements

A generally agreed definition of functional requirements is that it is
*a statement of a piece of required functionality or a behavior that
a system will exhibit under specific conditions*

[Grady Booch, James Rumbaugh, and Ivar Jacobson]

Complexity of Systems

Each feature/function of this smart car is provided using embedded computing (a combination of SW and HW) that has associated non-functional properties.

What are Non-Functional Requirements?

Conventionally, non-functional requirements are identified as **illities**

- ▶ Definition of non-functional requirements are generally based on *soft* criteria, which tend to be:
 - ▶ subjective,
 - ▶ ambiguous, and
 - ▶ conflicting

Example: a POV video stream processing software module for a drone that needs to be both **fast** (for real-time operation) and **power efficient** (to conserve battery power and extend operational range).

-ility/ilities

- ▶ understandability
- ▶ usability
- ▶ modifiability
- ▶ inter-operability
- ▶ reliability
- ▶ portability
- ▶ dependability
- ▶ flexibility
- ▶ availability
- ▶ maintainability
- ▶ scalability
- ▶ (re-)configurability,
- ▶ customizability
- ▶ adaptability
- ▶ stability
- ▶ variability
- ▶ volatility
- ▶ traceability
- ▶ verifiability
- ▶ predictability
- ▶ compatibility
- ▶ survivability
- ▶ accessibility
- ▶ ...

- ity/ities

- ▶ security
- ▶ simplicity
- ▶ clarity
- ▶ ubiquity

- ▶ integrity
- ▶ safety
- ▶ modularity
- ▶ ...

-ness

- ▶ user-friendliness
- ▶ robustness
- ▶ timeliness
- ▶ responsiveness
- ▶ correctness
- ▶ completeness
- ▶ cohesiveness
- ▶ ...

... and many more

- ▶ convenience
- ▶ comfort
- ▶ performance
- ▶ efficiency
- ▶ accuracy
- ▶ precision
- ▶ aesthetics
- ▶ consistency
- ▶ coherence
- ▶ fault tolerance
- ▶ self-healing capability
- ▶ autonomy
- ▶ cost
- ▶ development time
- ▶ time-to-market
- ▶ long-lasting battery
- ▶ low coupling
- ▶ ...

Example: Performance 1/2

Performance is a critical requirement for both interactive and non-interactive systems.

- ▶ In an **interactive** software system, performance defines how fast it responds to certain user actions under a certain workload
 - ▶ For example, the loading of a web page when the URL is clicked or typed or screen redraw in a computer game
- ▶ In a **non-interactive** software system, performance is measured by the amount of time taken to complete a certain task under a certain workload
 - ▶ For example, the training of a ML model using a particular training data set or sorting of a collection of data records

Example: Performance 2/2

Performance is impacted by a range of factors, many of them outside the control of engineers who do program construction.

- ▶ Generally, the performance metric specifies how much time a user must wait before the target operation is completed (the rendering of web page, rendering of gaming scenery, processing of a transaction, notification of task completion in ML model training or data sorting, etc) in the **context** of *execution environment* such as
 - ▶ Hardware resources (processors, processor cores, memory, storage, special hardware, etc)
 - ▶ System resources (OS type, libraries, and system parameters defining resource availability and limitations)
 - ▶ Run-time environment (for example, the number of users simultaneously active at the moment, background tasks in execution, etc)

Example: PageSpeed Insights 1/2

Performance

Values are estimated and may vary. The [performance score is calculated](#) directly from these metrics. [See calculator.](#)

▲ 0–49 ■ 50–89 ● 90–100

Google's page speed insights is a tool to measure a set of different performance score considering multiple scenarios such as type of network connection, type of content, and type of platform (desktop or mobile)

Example: PageSpeed Insights 2/2

METRICS

[Collapse view](#)

● First Contentful Paint

0.5 s

First Contentful Paint marks the time at which the first text or image is painted. [Learn more.](#)

● Time to Interactive

0.5 s

Time to interactive is the amount of time it takes for the page to become fully interactive. [Learn more.](#)

● Speed Index

0.6 s

Speed Index shows how quickly the contents of a page are visibly populated. [Learn more.](#)

● Total Blocking Time

0 ms

Sum of all time periods between FCP and Time to Interactive, when task length exceeded 50ms, expressed in milliseconds. [Learn more.](#)

● Largest Contentful Paint

0.5 s

Largest Contentful Paint marks the time at which the largest text or image is painted. [Learn more](#)

● Cumulative Layout Shift

0

Cumulative Layout Shift measures the movement of visible elements within the viewport. [Learn more.](#)

Performance and Usability

Jakob Nielsen [1], a Danish web usability consultant and human-computer interaction researcher considered the *guru of Web page usability* has suggested 3 main metrics for response time.

- ▶ **0.1 second** - the limit after which the system reaction does not seem instantaneous
- ▶ **1 second** - when user will notice the delay, but without interrupted flow of thought
- ▶ **10 seconds** - when user attention is completely lost

Although these metrics were suggested nearly 30 years ago in 1993 [2], as they are based on how human interaction works and determined by human perceptual abilities, the metrics remain meaningful and valid.

Example: Security

This is a complex non-functional requirement that seek to protect data and services/functions from unauthorized access and malware attacks.

- ▶ In program construction, most of the security non-functional requirements are mapped to specific functional requirements.
- ▶ Some example mappings are:
 - ▶ **identification and authentication** is mapped to a **login** process.
 - ▶ **authorized access** is mapped to an **access control matrix** of user identities, objects and system resources, and access rights.
 - ▶ **confidentiality** is mapped to an **encryption** process.

An example to try

Summary

Requirements must be documented to be easily understood by non-technical readers (customers) and technical readers (software developers).

	Functional requirements	Non-functional requirements
Objective	Describe what product does	Describe how product works
End result	Define product features	Define product properties
Focus	On user requirements	On user expectations
Documentation	Captured in Use Cases	Captured as a quality attribute
Origin type	Defined by user (mostly)	Defined by developers/experts
Testing	Component, Module, API, UI, ...	Performance, Usability, Security, ...
